Engineering Essentials: Fundamentals of Hydraulic Pumps
 A gear pump produces flow by carrying fluid in between the teeth of two meshing Variable-displacement, pressure-compensated vane pump. To investigate these differences, consider a simple circuit using a fixed-displacement pump
 The difference between gear pump and vane pump
 The difference between gear pump and vane pump · 1. All are reversed-type positive displacement pumps with certain self-priming capacity, but dry rotation is not

The Difference Between Vane and Piston Pumps - Dynamic
 Apr 27, 2019 — Vane pumps are hydraulic pumps which operate at a very low noise level as well as a lower flow pulsation (or constant flow) whilst reaching The Right Pump for the Job - Design World
 Jul 10, 2009 — A gear pump carries fluid between the teeth of two meshing gears. One gear is driven by the drive shaft and turns an idler gear. Gear and vane pumps are primarily used for fixed flow applications; they are positive displacement pumps that deliver the same volume for each cycle of the pumping element
